Job Swipe

Completed by *Daniel Kamener*

University of Pretoria

Revision History

Name	Date	Reason For Changes	Version
Daniel Kamener	11/08/2025	Initial Version	1.0

Introduction

Purpose

The purpose of this web application is to provide a modern and simple for job seekers to apply for jobs as well as for employees to easily find applicants to hire. This application will use the same format as most dating apps where the job seeker can swipe left or right at potential jobs and if they swipe right, the application will apply to the job for them without them having to do tedious administrative work. The current version number is 1.0 as this is the concept for the application. This SRS covers the main features of the application but does not discuss the backend of the system, thus, only outlying the primary function of the system.

Project Scope

The scope of the application is for job seekers to browse potential jobs and apply for them by swiping right on the application, with the application automatically submitting their CV and personal details to potential employers. Employers will have a simple and easy to manage dashboard where they can look and manage applicants in one centralized application. This will save lots of time and frustration on both the employer and job seekers side. This aligns with broader business goals of using modern technology to make the hiring process easier, faster, and more accessible for both job seekers and employers through a simple and user-friendly mobile platform.

Overall Description

Product Perspective

This product is a new, self-contained product to address the issues faced by job seekers and employers looking to hire. The concept came from trying to improve the old tedious methods of applying for jobs. This product is a standalone product, however, in the bigger picture it could integrate into HR platforms, applicant tracking systems, or job listing APIs.

Block Diagram

Product Functions

For Job Seekers:

- Create personal profile and store CV
- Browse available jobs using a swipe interface
- Automatically submit a CV and user details to the employer if the user swipes right
- View and manage history of jobs applied
- Message the employer (Only allowed if the employer starts the chat)
- Update profile

For Employers:

- Make and manage job listings
- View applicants in a centralized interface
- View applicants CV and details
- Message applicants
- Update company/job listing information

System Functions:

- Create, remove and update users
- Secure user authentication and data storage
- Real time syncing between frontend and backend
- Administration panel for monitoring app performance and user activity

User Classes and Characteristics

Job Seeker: (Primary User Class)	
Frequency of use	Very frequent as most users are anticipated to be job seekers
Functions Used	- Create personal profile and store CV - Browse available jobs using a swipe interface - Automatically submit a CV and user details to the employer if the user swipes right - View and manage history of jobs applied - Message the employer (Only allowed if the employer starts the chat) - Update profile
Technical Expertise	Basic to intermediate
Privilege level	Standard user – can only access user functions. Cannot access nor modify admin or employee functions
Education/Experience	Varies widely
Pertinent Characteristics	Job seekers require quick access to a simple and easy to use interface with minimal data entry.

Employer: (Secondary User Class)	
Frequency of use	Depends on hiring needs
Functions Used	- Make and manage job listings - View applicants in a centralized interface - View applicants CV and details - Message applicants - Update company/job listing information

Technical Expertise	Intermediate
Privilege level	Standard user – can only access user functions. Cannot access nor modify job seeker or employee functions
Education/Experience	Usually, professionals such as someone working in human resources
Pertinent Characteristics	Employers require an organized and easy to use interface to sort through all the applicant.

Admin: (Support Class)	
Frequency of use	Occasional – used for maintenance and resolving any issues
Functions Used	- Create, remove and update users - Secure user authentication and data storage - Real time syncing between frontend and backend - Administration panel for monitoring app performance and user activity
Technical Expertise	Advanced
Privilege level	Has full access to the system
Education/Experience	Highly technical
Pertinent Characteristics	Admin focuses on reliability and ensures the system is working as expected. Also ensures the app is secure for all users

Operating Environment

This application will run on web browsers as it is a web application meaning it will be able to run on any hardware or operating system that can run a web browser.

Design and Implementation Constraints

The application must be a full stack application where the frontend must be implemented using HTML, CSS, JavaScript with React.js or Vue.js. The backend must be implemented with Node.js and Express or C# or Python with Django/Flask. The database must be PostgreSQL or MongoDB, and authentication must be handled using JSON Web Tokens.

The performance requirements are that pages load in under two seconds on standard broadband, accessibility must comply with WCAG 2.1 AA standards and security must protect against XSS, CSRF, and SQL injection. Logging and error handling must include both client-side and server-side. Jira will be used for project management, Git for version control with regular commits, and Agile methodology with 1–2 week sprints.

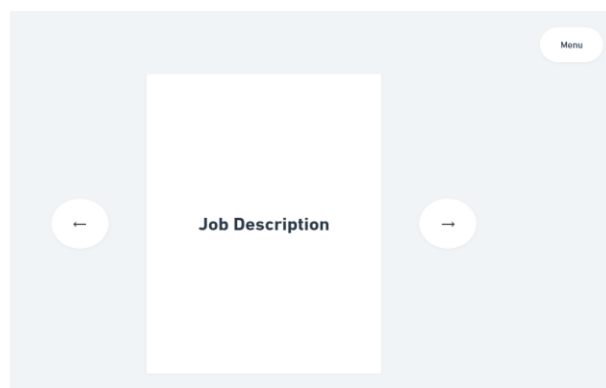

Assumptions and Dependencies

All users are assumed to have the hardware to run a web browser as well as an internet connection. It is assumed users are willing to provide their personal details and CV upon registration and that employers will actively be using the application to look through job applications. All backend services such as hosting and backend operations will be hosted on a third-party cloud computing to ensure reliability and real-time syncing.

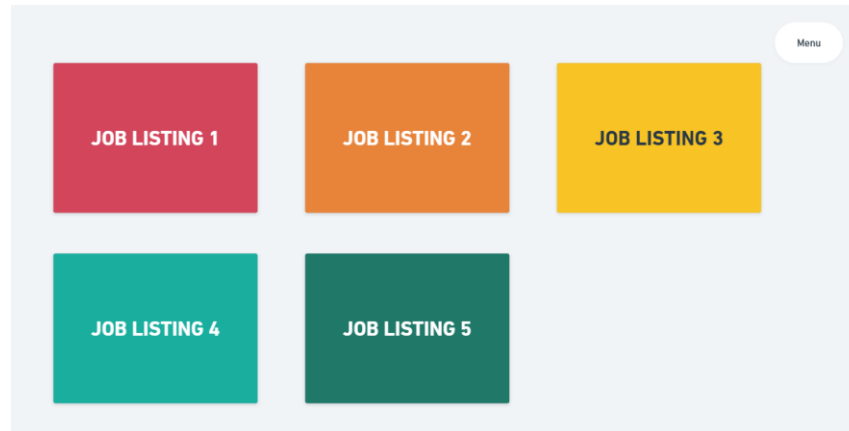

External Interface Requirements

User Interfaces

The user interface for the application will be a minimalist and simple UI. For job seekers there will be a main card in the middle showing the job with arrows on the left and right to indicate to the user that they must either swipe left or right. On the top right will be a menu button where they can go onto their messages and settings. A mockup of what this will look like is shown below:

From the employer side, there will be multiple cards showing all their listings. When they click on one, it will take them to a page where all the applicants will be displayed. They will also have a menu button on the top right to be able to go to messages or settings. A mockup is displayed below:

Hardware Interfaces

This application is designed for desktops, laptops and smartphones that have access to the internet and a web browser. Users will interact with the web application either by touch screen (for mobile phones) or with a keyboard and mouse (for laptops and desktops). The application will only collect location data from the user but no other hardware data. It communicated with backend servers with HTTPS. The Web application will interact with the devices network card to use the internet to send and receive data.

Software Interfaces

This application runs on a web browser which runs on the devices operating system. The application will be made with HTML, CSS, JavaScript and React for the frontend. For the backend, Node.js and express will be used and data will be stored using MongoDB. JSON web tokens will be used for web tokens and Jest will be used for testing. Documentation will be made with Markdown and OpenAI and the project will be managed through Jira. Finally, the application will be deployed with Netlify.

Communications Interfaces

This application communicates with backend servers through HTTPS which ensures secure and encrypted data transmission. All communication will be done through a RESTful JSON API (Application Protocol Interface). Web tokens will be used to ensure security by proving authentication. Data will be stored through a centralized database and will thus allow for synchronization.

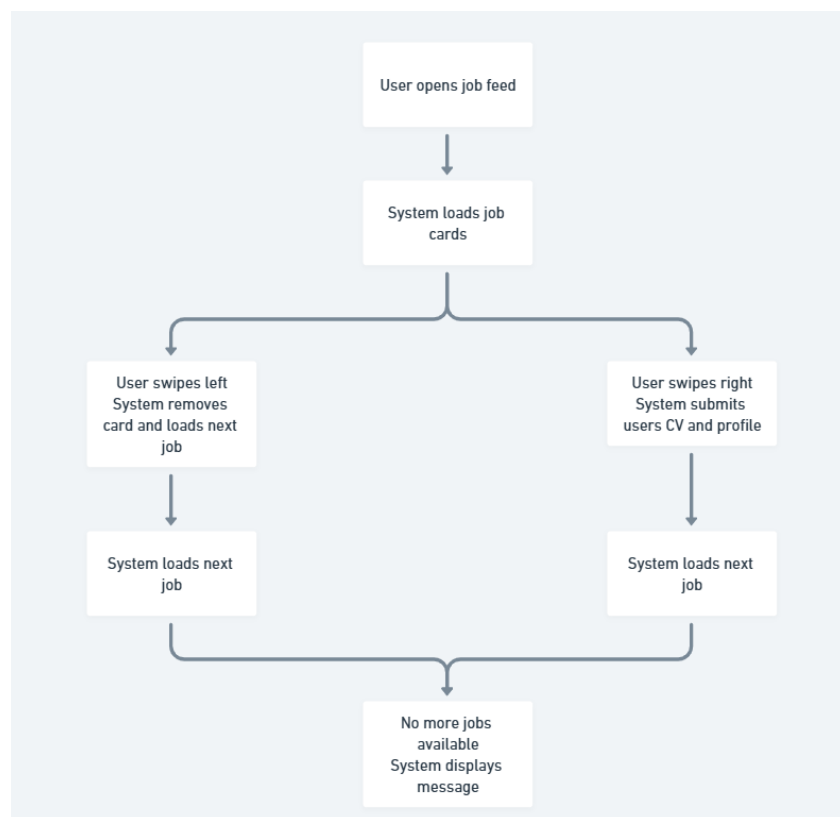

System Features

Job Feed

Description and Priority

Job seekers will be given a feed of potential jobs where they will have the option to swipe left or right on the post. If they swipe left, the opportunity to apply for that position will be declined. If they, however, swipe right the application will automatically submit an application for the user to the application they swiped right to. This is a high priority feature as it is part of the core functionality of the application.

Stimulus/Response Sequences

Functional Requirements

JREQ-1: System will show user jobs retrieved from a database when the user loads the home page.

JREQ-2: Each job will show the name, address, description and other optional information like amount they will pay, etc...

JREQ-3: Users can swipe left to decline the offer

JREQ-4: If the user swipes left, the offer will never show again and a new offer will show.

JREQ-5: Users can swipe right to apply for the job

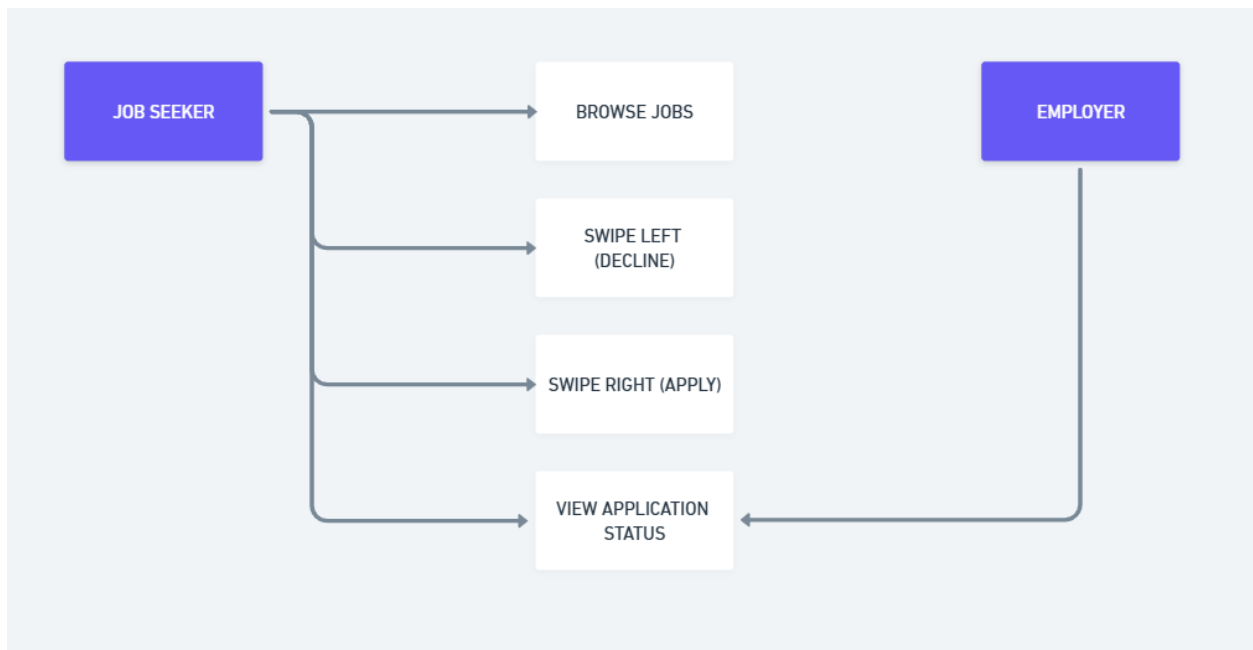

JREQ-6: If the user swipes right, the system will apply for that position by sending the employer all the information needed.

JREQ-7: Once the user's information is sent, a new job listing will appear.

JREQ-8: If no more jobs are available then a message will appear on the users feed.

JREQ-9: The system will only apply once for a user to avoid duplicate applications

Formal Use Cases

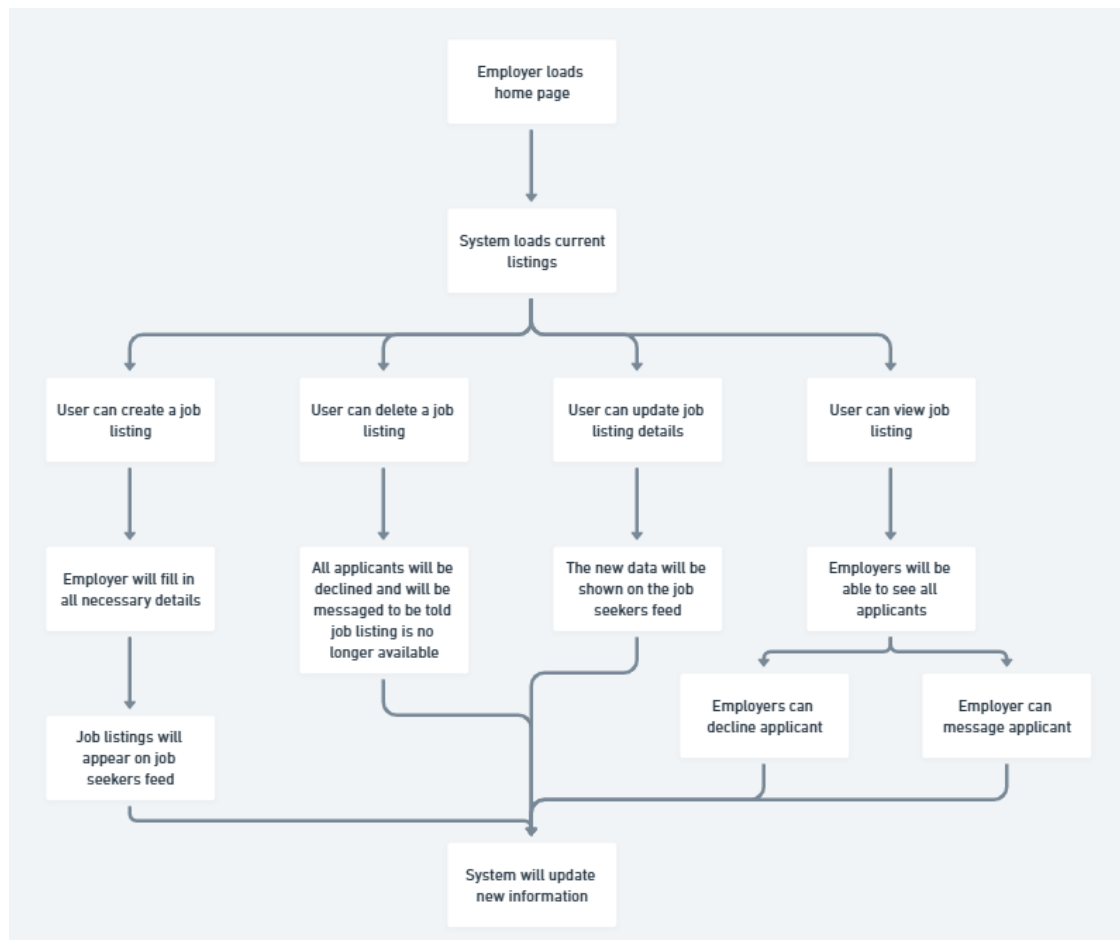

Job Listing

Description and Priority

Employers are able to list jobs that they want applicants for to hire. They are able to create, delete and update details of each listing. They are also able to view all applicants that have applied for that position and either decline their application or message the applicant to set up a meeting or arrange the next step. This is a high priority feature as it is part of the core functionality of the application.

Stimulus/Response Sequences

Functional Requirements

EREQ-1: System will show user all current job listings

EREQ-2: User is able to delete a job listing

EREQ-3: User can update job listing information

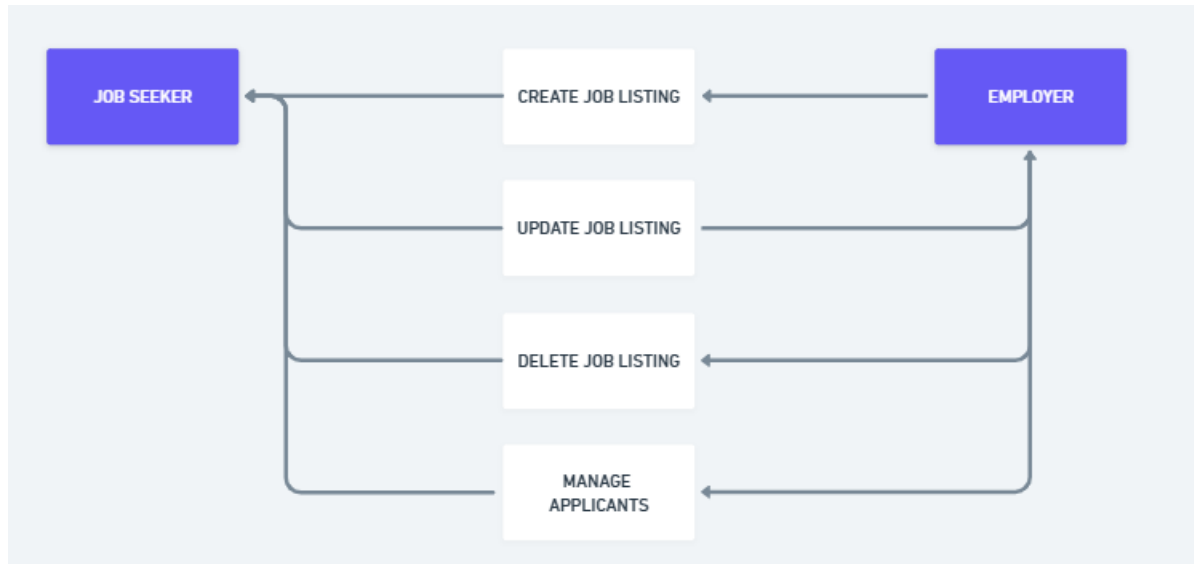

EREQ-4: User can view all applicants for a job listing

EREQ-5: User can decline applicant

EREQ-6: User can message applicant

EREQ-7: User can create a job listing

Formal Use Cases

Other Nonfunctional Requirements

Performance Requirements

The page loads must be <2 seconds on standard broadband

Security Requirements

All users' data including name, password, CV and any other data must be stored in a secure manner that cannot be accessed by anyone other than that user. Passwords must be encrypted using the latest standard of encryption AES-256 and data must be sent over a secure channel using HTTPS. Role based access will be made so that users will only be able to access what is relevant to them. The application must protect against XSS, CSRF, and SQL injections.

Software Quality Attributes

This application prioritizes usability. Users should be able to access and use this web application with minimal training. The application should be simple and easy to use. The application must also prioritize availability as the application must be up and running majority of the time and must follow WCAG 2.1 AA standards for UI. The application must also be maintainable with clean, commented and modular code that allows for bug fixes and future updates. Finally, the code must be scalable and must use modular code and data structures to allow extension of the program.
